

1. Create a new React app
2. Clean your app
3. Make App.js a class component
4. Make Card.js and Animals.js function components
5. The card must have
 - a title,
 - likes icon,
 - count of likes,
 - add and remove like buttons
 - remove the card button.
6. Use the AnimalsList.js file and add the animals array to the state
 - Declare event handler for likes
 - By using **useState**, make functionality for likes
 - Declare event handler for removing the animal card
 - Pass the animals list to Animals.js
7. Add a search input for filtering the animal's array list.
8. **Style** your application

You just recapped your knowledge of **handling events**, **changing states**, and how to style components.

Well done!
